

Comprehensive Survey of Forensic Psychiatric Facilities in the United States

**ROBERT B. SHELDON, M.D., and
WM. BARRY NORMAN, Ph.D.***

The psychiatric treatment of individuals charged with criminal offenses has been hampered, historically, by inadequate funding and staffing, as well as by a lack of information dissemination to the general public. The fact most often overlooked in reference to the mentally disordered offender is that psychiatric treatment and care are not sufficient ends in themselves; society must be protected from these individuals while treatment is in progress.

Most states now provide hospital facilities for pre-trial psychiatric evaluations, as well as for the extended treatment of mentally disordered offenders. These facilities, commonly referred to as Maximum Security Units or Forensic Psychiatric Units, are usually attached to a state psychiatric hospital. Because of the locations of these special units, treatment has had to share common ground with security. Adequate security is a prerequisite for treatment, for if the patient cannot be protected from himself as well as from others, any attempt at providing care would be futile. Perhaps the most disturbing by-product of adequate security is inadequate treatment, although this is not always true.

As noted, each state has some procedure for pre-trial evaluations of those individuals accused of a felony, if such an evaluation is deemed necessary. In addition, some type of treatment facility is usually available for those offenders whom the courts decide are incompetent to stand trial or who are in need of psychiatric treatment. For the most part, these facilities would not be regarded as adequate if they were to house any population except mentally disordered offenders. Older wards are often utilized for the maximum security patients, if only because the buildings tend to be more secure in design than more modern structures. Space is often limited, especially areas needed for individual and group therapy. Overcrowding is not uncommon, a condition which adds to the already potentially explosive situations. The exceptions appear to be those buildings specifically designed for forensic patients, and even these may not meet the standards for accreditation. Units for these patients exist in order to serve the state as a diagnostic and evaluation facility as well as to ensure that the more hostile and aggressive psychiatric patients will receive residential care. Although

*Dr. Sheldon is currently physician with the Texas Department of Corrections, Coffield Unit, Palestine, Texas. Previously, Dr. Sheldon was the Superintendent, Rusk State Hospital, Texas. His major area of interest is forensic psychiatry. Dr. Norman is the Chief Clinical Psychologist in the Forensic Unit of Rusk State Hospital, Rusk, Texas 75785. He is interested in forensic psychology and psychodiagnostics. Correspondence should be addressed to Dr. Norman at Box 318 of the Hospital.

such buildings were initially designed for short-term residence, there is a serious effort underway to provide more comprehensive evaluations and above-average treatment for those patients who spend several months in these units.

The uniqueness of the mentally disturbed offenders and the services they require has led to a survey of forensic psychiatric units in the United States. Previously published information on forensic units listed institutions that serve the mentally disordered offender, but did not provide details of the individual programs.¹ An attempt has been made here to provide more detailed information on institutions that have specialized forensic facilities.

Procedures

A list of institutions that serve the mentally disordered offender was obtained and used as a guide for gathering the information.² In July, 1976, a telephone survey was conducted in order to provide current information on the various forensic units. A questionnaire was utilized by the individual conducting the survey so that similar queries were put to the numerous hospital spokesmen in a similar manner. In order to obtain correct data on security and the security systems, the caller was identified as an employee of a state hospital housing a forensic psychiatric unit.

In February, 1977, 15 of the forensic units were chosen randomly and re-called. This random check of the information was performed in order to provide some assurance that the information previously obtained was correct and that the procedures were somewhat reliable.

Results

The results obtained from the extensive telephone survey are presented in Tables 1 and 2. Table 1 contains general information on each facility which houses a forensic program.

Listed alphabetically by state, each facility is identified by the general hospital to which it is attached, and with the name of the particular unit or program, if such is the case. Additionally, bed capacities of the forensic programs are noted, along with the average number of occupied beds. Accreditation status by Joint Commission on Accreditation of Hospitals is also noted. Please be aware that a given institution's status may have changed since the survey was conducted, as these procedures are ongoing. Primary therapeutic intervention techniques are listed if the information was provided.

The remainder of the information is concerned with personnel dispersement in the programs. The numbers of physicians, psychologists, social service workers, nursing staff, security personnel and miscellaneous therapists are given. These personnel listings include, in some cases, part-time personnel.

Table 2 provides data which is security-oriented in nature. Listed alphabetically by state, information on security measures and security personnel for each facility is briefly outlined. Additionally, types of room accommodations and visitation policies are provided.

Discussion

The in-patient care of the mentally disordered offender has not proceeded in a very effective manner in the United States. Inadequate funding, failure to attract competent professional and security personnel, and a limited knowledge of what produces desired results and what does not have combined so that progress is limited. This survey addresses what is available in each state, although it is what is not available that hinders effective treatment.

In compiling and analyzing the data for the various state programs, it became apparent that not much therapy, either group or individual, is available to the mentally disordered offender population. Chemotherapy, though widespread, cannot alleviate a patient's problems. Similarly, psychotherapy cannot be expected to produce miracles. The treatment of choice in most facilities is skilled psychotherapy combined with chemotherapy supported by an accepting environment. This is especially true when dealing with forensic patients who can exhibit either simple behavior/disciplinary problems or psychiatric programs, or, more commonly, a mixture of both.

Security personnel do not mix with the patients in all the institutions. These individuals, or other paraprofessional staff, provide the patients with 24-hour-a-day supervision, while the professional staff is available only eight

hours a day. These individuals should provide a feeling of normalization, or at least serve as role models, for the patients. This end becomes increasingly difficult to accomplish if they are not allowed to mix with the patients as much as possible. Many facilities are further hampered because they do not have the staff to keep the patients productively occupied, and the paraprofessionals are required to perform basic custodial care rather than any type of structured treatment.

As noted in the tables, all facilities have provisions for visitors, but in most cases visitors are limited to specific days of the week or a set number of visits per patient. Structure needs to be provided if any type of treatment program is to be operated effectively, but visitors could be restricted to specific hours of the day, seven days a week. An interesting development in 12% of the forensic programs is conjugal visitation. Even though acute-care hospitals in the United States do not condone conjugal visitation, several programs for mentally disordered offenders have had the foresight to offer this small, though humanizing, privilege. Several other forensic units, while not explicitly granting conjugal visitation, do so implicitly by allowing their patients to work and sometimes sleep in the community. For any type of treatment to be effective, it must be individualized, and this privilege is one more step in attaining the goal of individualized treatment.

The usual disbursement of forensic psychiatric facilities is one in each state. While few states have specially designed forensic hospitals, some of these facilities, such as those in California, Ohio, and Pennsylvania, have become quite large, necessitating the development or construction of specialized units or hospitals. Perhaps an alternative to constructing large, expensive facilities in one area would be to utilize smaller units throughout a state. As psychiatric/psychological evaluations of individuals involved in the criminal justice system are becoming more commonplace, this dispersal of treatment units would enable the staff to provide better services, and it might also enable some patients to remain closer to their families (Texas's facility is 750 miles from one of the larger cities). Additionally, services need to be available for adolescents and females. Although the population description of the facilities was not addressed here, most institutions serve only adult males. Though programming for these individuals is expensive, it is far less expensive than repeated incarcerations; the broadening of services to include adolescents and females should be a priority.

Effective treatment of this unique population requires more than mastery of basic clinical skills. It requires some knowledge of both the legal system, including mental health and criminal codes, and the correctional system. Additionally, the staff needs to become familiar with the "con" culture, which supports maladaptive values and behavior, as well as the symptomatology fostered by long periods of semi-isolation on locked wards. The treatment of mentally disordered offenders is far from ideal, but as the programs outlined here demonstrate, there exists a serious effort to move toward more effective service for these patients.
